 NOTE: This is a 'working draft' sequence. It currently consists of 2 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

 Contact: humquery@sanger
 NOTE: This is a 'working draft' sequence. It currently consists of 13 contigs. The true order of the pieces is not known and their order in this sequence record is ransitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

 chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by
 Female blood was obtained via a double-blind selection protocol. Female blood DNA was isolated from one randomly chosen donor (out of 10 female donors) and partially digested with a combination of EcoRI and EcoRI wethylase for library segments 1&2 or either MboI or DpnII for library segments 3&4. Size selected DNA was cloned into the pBACe3.6 vector between the EcoRI sites for library segments 1&2 or the BamHI sites for library segments 3&4. The ligation products were transformed into DH10B electrocompetent cells (BRL Life Technologies). The library has been arrayed into 3&4 well microtiter dishes and also gridded onto 22x22cm nylon high density filters for screening by probe hybridization.
 The RPCI-13 Human Female BAC Library was constructed using improved cloning techniques developed by Kazutoyo Osoegawa. The library was generated by Bachui Zhao in our laboratory. Construction was funded by a grant from the National Human Genome Research Institute (NHGRI, NIH) (#1R01RG01165-03). The library was generated according to the new NHGRI/DOE 'Guidance on Human Subjects in Large-Scale DNA
 Mapping information for this chone was provided by Dr. John D. McPherson, Department of Genetics, Washington University, St. Louis MO. For additional information about the map position of this sequence, see http://genome.wustl.edu/gsc
 SOURCE INFORMATION:

CLONE LENGTH: This sequence does not necessarily represent the entire insert of this clone. Overlapping regions of clones are c sequenced and submitted once, so the sequence for the remainder the insert may be found in the record for the adjacent clones. Overlapping clones are noted at the beginning and end of the Features listing. only r of

ANNOTATION OF FEATURES:
STSs are identified using ePCR (Genome
of a local database that includes entries
local mapping efforts. Res. 7:541-550) searches from dbSTS, GDB, and

Repeats are identified using RepeatMasker (A. Smit and P. Green, unpublished.) for Human and Mouse sequences.

Genes and Region of sequence similarity are identified by BLAST (Nuc. Acids Res. 25:3389-3402) similarity (expect < 1e-34) to the EST and CDNA sequences. Genes demonstrate at least two exons flanked by consensus splice sites that maintained sequence continuity across the splice junctions. Sequences that are not identical matches are annotated as similar.

SEQUENCING READ COVERAGE: Sequencing is completed to a minimum standard of double strand coverage with a minimum of 2 clones and 2 reads with no ambiguities or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities. If the sequence quality for a region does not meet this standard, it will be indicated in the annotation as Low Coverage.

QUALITY OF INDIVIDUAL BASES: This sequence meets stringent quality standards - estimated error rate less than 1 per 10,000 bases. Reports of lowest quality individual bases and measures of base quality are listed below. Description of the metrics can be found at URL: http://gc.bcm.tmc.edu:8088/quality.info/genbank.annotation.

 Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

 The present sequence is one of a large number of 5' ESTS derived from mRNAs encoding secreted proteins. An ORF has been identified within the sequence. The 5' ESTS were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. ESTS sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTS are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion

The present sequence is the cDNA encoding the human chisel gene (Csl) that is mapped to the human chromosome Xq21.3-q22. It comprises 5 exons. It is a member of the EF-Hand protein super family and is involved in signalling pathways. It is predominantly expressed in heart and skeletal muscles and is activated after the differentiation of cells. Csl functions in regulation aspects of differentiation or adaptive processes that maintain muscle homeostasis. This sequence can be used in the detection, diagnosis, prophylactic and therapeutic treatment of diseases such as those involving aberrant muscle cell development and functional activity. It is also used in the treatment of muscular and myotonic dystrophies skeletal myopathies such as buchemne muscular dystrophy and myocarditis, myofiber atrophy, heart failure, cardiac hypertrophy, myocarditis, myofiber atrophy, etc. The Csl gene sequence can also be used in gene therapy, for the production of transgenic animals and for

tissues and their corresponding proteins. The invention also relates the section discussed in the prediction and their corresponding proteins. The invention also relates to methods for assessing the expression level of these genes. The method is used for testing the predisposition of mammals and preferably humans for a heart disease or for an acute state of such a disease. It is also useful to treat disease of the heart such as congestive heart failure, dilative cardiomyopathy, hypertrophic cardiomyopathy, ischaemic cardiomyopathy, specific heart muscle disease, rhythm and conduction disorders, syncope and sudden death, coronary heart disease, systemic arterial hypertension, pulmonary hypertension, pulmonary heart disease, valvular heart disease, congenital heart disease, pericardial disease and endocarditis. Sequences of the invention are also used in gene therapy. A transgenic non-human mammal comprising the sequences of the invention are useful for the development for medicaments for the treatments of

AAX10269-X12937 are human DNA fragments which contain biallelic polymorphic markers which have been isolated using the primers crepresented in AAX09121-X10268. The base occupying the polymorphic site indicated by the appropriate IUPAC-IUB ambiguity code. These fragments can be used in methods for determining polymorphic forms in an individual corn see in e.g. forenaiscs, paternity testing or for phenotypic typing for diseases such as agammaglobulinemia, diabetes insipidus, Lesci-Nyhan syndrome, muscular dystrophy, Wiskott-Aldrich syndrome, Fabry's disease, familial hypercholestrolemia, polycystic kidney disease, hereditary spherocytosis, von Willebrand's disease, tuberous sclerosis, hereditary capercytosis imperfecta, acute intermittent porphyria, hereditary hemorrhagic telangiectasia, familial colonic polyposis, Bhlers-Danios syndrome, osteogenesis imperfecta, acute intermittent porphyria, autoimmune diseases, inflammation, cancer, diseases of the nervous system, infection by pathogenic microorganisms, and characteristics such as longevity, appearance (e.g. baldmess, obesity) strength, speed, endurance, fertility, and susceptibility or receptivity to particular drugs or therapeutic treatments. The isolated polymorphic nucleic acid segments can also be used to produce medicaments for the treatment or

 The present invention provides the protein and coding sequences of a number of a poptosis associated proteins from the yeast Saccharomyces cerevisiae and the fungus Candida albicans. These can be used to identify treatments for fungal and yeast infections, for proliferative diseases and for apptosis related diseases such as autoimmune diseases, ischaemia and neurodegeneration. The present sequence is one of the C. albicans coding sequences of the invention.
 Yeast and fungal nucleic acids encoding proteins involved in a pathway leading to programmed cell death, useful for treating proliferative disorders, yeast and fungal infections, or for preventing apoptosis in

 The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV0010-ABV62213) of the specification or its complement. (I) is useful for:
(a) assessing whether a patient is afflicted with prostate cancer;
(b) monitoring the progression of prostate cancer in a patient, cancer in a patient,
(c) assessing the efficacy of a test compound to inhibit prostate cancer in a patient;
(d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient;
(e) selecting a composition for inhibiting prostate cancer in a patient;
(f) assessing the prostate call carcinogenic potential of a compound;
(g) determining whether prostate cancer has metastasized in a patient;
(h) assessing the aggressiveness or indolence of prostate cancer in a

(HUMA-) HUMAN GENOME SCI INC

Rosen CA, Barash SC, Ruben SM

WPI; 2001-483426/52,

Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis -

Disclosure; SEQ ID NO 33178; 3071pp + Sequence Listing, English.

AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I)

amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic
activity, and can be used in gene therapy and vaccine production. (I)
proteins and polynucleotides may be used in the prevention, diagnosis and
treatment of diseases associated with inappropriate (I) expression. For
example, they may be used to treat disorders associated with decreased
expression by rectifying mutations or deletions in a patient so genome
that affect the activity of (I) by expressing inactive proteins or to
supplement the patients own production of (I). Additionally, (I)
cuplynucleotides may be used to produce the secreted (I), by inserting
the nucleic acids into a host cell and culturing the cell to express the
protein. (I) proteins and polynucleotides may be used to prevent,
cancers and cancer metastases of haematopoietic-terived cells. AAK64703
concers and cancer metastases of haematopoietic antigen genomic
to AAK87694 represent human immune/haematopoietic antigen genomic
sequences from the present invention. AAK54942 to AAK84950 and AAM82169
crepresent sequences used in the exemplification of the present invention.

```
The invention relates to novel genes (AALi34669-AALi37666) and proteins (ABB03087-ABB04199) associated with the musculoskeletal system useful for preventing, treating or ameliocating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant) agonists are useful in the disgnosis, treatment and prevention of: (a) cancer. e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune cancers e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infectious diseases such as viral, bacterial, fungal and
 parasitic infections.
Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

a plant

The present invention relates to a recombinant DNA construct of a plan (Arabidopsis thaliana) centromere. The constructs are useful for producing stably inherited michicosomes which can serve as vectors for the construction of transganic plant and animal cells expressing selected proteins such as hormones, enzymes, interleukins, clotting factors, cytokines, antibodies, and growth factors.

 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell interactions in higher enkaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
 New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
 New nucleic acid fragment, primers and probes - useful for detection of non-A-B-C-D-E type hepatitis virus
 Gaps
 A primer for the detection of non-A-B-C-D-E-F type hepatitis virus or hepatitis G virus (HGV), comprises a HGV nucleic acid fragment, e.g. the present sequence. The primers may be used for the detection of HGV via PCR.

This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by restriction digest.

MAPPING INFORMATION:
This clone was mapped by Grieff, M., Whyte, M. P., Thakker, R. V., and Mazzarella, R. Sequence analysis of 139 kb in Xp22.1
containing spermine synthase and the 5' region of PEX. Genomics

This clone is from a chromosome X-specific cosmid library LLOXNCC01 'U'. The source of the chromosomes was a human/hamster hybrid, GM07299-F, from Robert Nussbaum at the University of Pennsylvania School of Medicine. Please contact the Lawrence Livermore National Laboratory at http://www-bio.llnl.gov/genome to obtain the clone. VECTOR: Lawristl6

Univect Submassion

Univect Submassion

Univect Submassion

Univect Submassion

CB10 1SA, UK. E-mail enquiries: humquery@sanger.ac.uk Clone

requests: clonerequest@sanger.ac.uk

On May 11, 2001 this sequence version replaced gi:1374045.

During sequence assembly data is compared from overlapping clones.

Where differences are found these are annotated as variations

together with a note of the overlapping clone name. Note that the
variation annotation may not be found in the sequence submission

corresponding to the overlapping clone, as we submit sequences with

only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all

regions were either double-stranded or sequenced with an alternate
chemistry or covered by high quality data (i.e., phred quality >=
30); an attempt was made to resolve all sequencing problems, such

as compressions and repeats; all regions were covered by at least

on pleamid subclone or more than one Mil subclone; and the
assembly was confirmed by resolve all sequencing and the
assembly was confirmed by resolve the following

abbreviations are used to associate primary accession numbers given
in the feature table with their source databases Em., EMBL; Sw.,
SWISSPROT; Tr., TREMBL; Wp., WORMPEP; Information on the WORMPEP

database can be found at

http://www.sanger.ac.uk/kProjects/C_elegans/wormpep This sequence

was generated from part of bacterial clone contigs of human

chromosome 6, constructed by the Sanger Centre Chromosome 6 Mapping

Group. Puww. anager.ac.uk/HGP/Chr6

RPII-80A23 is from the library RPCI-11.1 constructed by the group

of Pieter de Jong. For further details see
 http://www.chori.org/bacpac/home.htm
VBCTOR: pBAC63.6
IMPORTANT: This sequence is not the entire insert of clone
SECTIONS only once, except for a 100 base overlap.
The true left end of clone RP11-295F4 is at 44843 in this sequence.
The true right end of clone RP11-560I21 is at 100 in this sequence.

/note="Organ: eye; Vector: pT713-Pec (Pharmacia) with a modified polylinker; Site_1: EcoR I; Site_2: Not I;
UI-EDXO is a cDNA library containing the following tissue(s): fetal eyes. The library was constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. First strand cDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, digested with Not I, and cloned directionally into pT713-Pac vector. The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tag for this library as AGANTCAAGA, This library was created for the program, Gene Discovery in the Visual System, supported by National Eye Institute (NEI)."

```
The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. An ORF has been identified within the sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upperraam regulatory sequences and to design expression and secretion

 BY REAL BY THE FIFTHER SON TO SENT THE ```

(MEDI-) MEDIGENE AG.

```
The patent discloses novel target genes abnormally expressed in heart tissues and their corresponding proteins. The invention also relates to methods for assessing the expression level of these genes. The method is used for testing the predisposition of mammals and preferably humans for a heart disease or for an acute state of such a disease. It is also useful to treat diseases of the heart such as congestive heart failure, dilative cardiomyopathy, hypertrophic cardiomyopathy, ischaemic cardiomyopathy, specific heart muscle disease, rhythm and conduction disorders, syncope and sudden death, coronary heart disease, systemic arterial hypertension, pulmonary hypertension, pulmonary heart disease, walvular heart disease, congental heart disease, pericardial disease and endocarditis. Sequences of the invention are also used in gene therapy.

A transgenic non-human mammal comprising the sequences of the invention are useful for the development for medicaments for the treatments of the form of the constant of the 
                                                                                                                                                        Identifying a subject at risk for a heart disease e.g. congestive heart failure, dilative cardiomyopathy, heart muscle disease, by quantifying the polypeptide expressed by genes abnormally expressed in heart tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Chisel gene; Csl; EF-Hand protein super family; muscle development; heart/skeletal muscle cell development; signalling pathway; regulation; Xq21.3-q22; adaptive process; muscle homeostasis; skeletal myopathy; detection; diagnosis; prophylaxis; treatment; cardiac hypertrophy; muscular and myotonic dystrophy; Duchenne muscular dystrophy; therapy; Becker's myotonic dystrophy; heart failure; differentiation; exon;

The present sequence is the cDNA encoding the human chisel gene (CB1) that is mapped to the human chromosome Xq21.3-q22. It comprises 5 exons.

It is a member of the EF-Hand protein super family and is involved in signaling pathways. It is predominantly expressed in heart and skeletal muscles and is activated after the differentiation of cells. Csl functions in regulation aspects of differentiation or adaptive processes that maintain muscle homeostasis. This sequence can be used in the detection, diagnosis, prophylactic and therapeutic treatment of diseases such as those involving aberrant muscle cell development and functional activity. It is also used in the treatment of muscular and myotonic dystrophy, heart failure, cardiac hypertrophy and myocarditis, myofiber atrophy, etc. The Csl gene sequence can also be used in gene therapy, for the production of transgenic animals and for

myofiber arrophy, etc. The Cal gene sequence can also be used in gene therapy, for the production of transgenic animals and for drug screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is the cDNA encoding the murine chisel gene (Csl) that is mapped to the mouse X chromosome. It is a member of the EF-Hand protein super family and is involved in signalling pathways. It is predominantly expressed in heart and skeletal muscles and is activated after the differentiation of cells. Csl functions in regulation aspects of differentiation or adaptive processes that maintain muscle of differentiation or adaptive processes that maintain muscle homeostasis. This sequence can be used in the detection, disgnosis, prophylactic and therapeutic treatment of diseases such as those involving aberrant muscle cell development and functional activity. It is also used in the treatment of muscular and myotonic dystrophies, skeletal myopathies such as buchenne muscular dystrophy, myocarditis,
                                                                                                                                                                                                                                                Chisel gene; Cal; EF-Hand protein super family; muscle development; heart/skeletal muscle cell development; signalling pathway; murine; X chromosome; regulation; adaptive process; muscle homeostasis; detection; diagnosis; prophylaxis; treatment; skeletal myopathy; muscular and myotonic dystrophy; Duchenne muscular dystrophy; therapy; Becker's myotonic dystrophy; heart failure; cardiac hypertrophy; differentiation; gene therapy; transgenic animal; drug screening; ss.

This sequence represents CDNA encoding maize endosperm C-24 sterol
methyltransferase ESMT-1. The CDNA encoding ESMT-1 was selected from an
EST (expressed sequence tag) database on the basis of its sequence
identity with the N-terminal portion of the yeast ERG6 protein. The
predicted amino acid sequence of ESMT-1 shows 66% similarity and 46%
control predicted amino acid sequence of ESMT-1 shows 66% similarity and 46%
control predicted amino acid sequence of ESMT-1 shows 66% similarity and 46%
control predicted amino acid sequence of ESMT-1 shows 66% similarity and 46%
control metabolism. Sterol metabolism. Sterol intermediates at carbon 24. Nucleic acids encoding
ESMT-1 may be used in the generation of transgenic plants having altered
maintenance of membranes of most eukaryotic cells; however, insects,
control metabolism. Sterols are essential for the synthesis and
maintenance of membranes of most eukaryotic cells; however, insects,
control may be useful in altering sterol metabolism in plants and protects
control plants against infestation by pests such as insects, nemacodes and some
infestation, without the need for chemical pesticides which may be toxic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /*tag= a /*t

This DNA molecule codes for the S-adenosyl-L-methionine-delta24(25)
sterol methyltransferase (SMT) enzyme (see AAW70838) of corn. SMT
catalyses the transfer of a methyl group from S-adenosyl-L-methionine
to the C-24 centre of the sterol side chain. Full-length corn SMT
cDNA was isolated from a commercial corn cDNA library by PCR
amplification. The invention relates to transgenic plants with
modified sterol biosynthetic pathways. Phytosterol compositions are
modified sterol biosynthetic pathways. Phytosterol compositions are
modulated in the transgenic plants to confer resistance to insects,
cmodulated in the transgenic plants to confer resistance to insects,
nematodes, pythiaceous fungi and/or other environmental stresses
such as drought or cold, and/or to improve nutritional value, e.g.
by increasing levels of cholesterol-lowering sterols. SMT DNA
molecules (including antisense molecules) can be transformed into
plant cells, and plants (especially tomato, corn or soybean) having
attered sterol compositions are then regenerated.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to novel genes (AAH68727-AAH73383) associated with cervical cancer with cytostatic activity. The nucleic acids and encoded polypeptides to useful: to assess if a patient is affiliated with cervical cancer or has a pre-malignant condition; to monitor the progression of cervical cancer or a premalignant condition in a patient; and to select and/or assess the efficacy of a compound or therapy for inhibiting cervical cancer in a patient. The nucleic acids may also be useful for gene therapy.
                                                                                                                                                                                                                                                                                                                               Cervical cancer; cytostatic; pre-malignant condition; gene therapy; ss.

AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I)

amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic
activity, and can be used in gene therapy and vaccine production. (I)
proteins and polymucleotides may be used in the prevention, diagnosis and
treatment of diseases associated with inappropriate (I) expression. For
example, they may be used to treat disorders associated with decreased
expression by rectifying mutations or deletions in a patient's genome
that affect the activity of (I) by expressing inactive proteins or to
supplement the patients own production of (I). Additionally, (I)
couplement diseases and polymucleotides may be used to produce the secreted (I), by inserting
the nucleic acids into a host cell and culturing the cell to express the
protein. (I) proteins and polymucleotides may be used to prevent,
diagnose and treat immune/haematopoietic-related diseases, especially
cancers and cancer metastesses of haematopoietic antigen genomic
to AAK87694 represent human immune/haematopoietic antigen genomic
sequences from the present invention. AAK54942 to AAK54950 and AAM82169
crepresent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                     Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               6464 AAATACAAAAATTCGCTGGGCATGGTGGTGGCAGGCAGCCTCAGGAGCTGAGACAGAAGAAT 6523

The invention describes a method of monitoring differential expression of other Bacillus cells, comprising hybridising labelled nucleic acid probes to the facillus cells, comprising hybridising labelled nucleic acid probes isolated from Bacillus cells, to a substrate containing array of Bacillus cells to a substrate containing array of Bacillus gene expression by an observed hybridisation reporter signal of a spot in the array. The method is useful for mesuring the expression of genes in a first Bacillus cells. The method is useful for monitoring of substrates or more second Bacillus cells. The method is useful for monitoring genes, identifying possible functions of unknown open reading frames and contituing gene copy number variation and stability. Monitoring changes in which Bacillus cells adapt to changes in culture conditions.

Committee are copy number variation and stability. Monitoring changes in which Bacillus cells adapt to changes in culture conditions.

Collow-up characterisation is unnecessary, when one spot on an array candlad one gene or one open reading frame, since sequence information is when expression of the invention.

Collow-up characterisation is unnecessary, since sequence information is when when do fit the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Note: The sequence data for this patent did not form part of the printed apecification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                          Monitoring differential expression of several genes in first Bacillus cell relative to expression of same genes in one or more second Bacillus cells, by using substrate containing Bacillus genomic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ftp.wipo.int/pub/published_pct_sequences.

The present invention describes primer sets for synthesising 5602

full-length cDNAs defined in the specification. Where a primer set

comprises: (a) an oligo-dT primer and an oligonucleotide complementary

to the complementary strand of a polynucleotide which comprises one of

compouncleotide comprises at least 15 nucleotides; or (b) a combination

oligonucleotide comprises at least 15 nucleotides; or (b) a combination

of an oligonucleotide comprising a sequence complementary to the

complementary strand of a polynucleotide which comprises a 5'-end

sequence and an oligonucleotide comprising a sequence complementary to the

complementary strand of a polynucleotide which comprises a 5'-end

sequence and an oligonucleotide comprising a sequence complementary to a

polynucleotide which comprises at least 15 nucleotides and the combination of

the 5'-end sequence 3'-end sequence; where the

oligonucleotide which comprises at least 15 nucleotides and the combination of

the 5'-end sequence 3'-end sequence 16 selected from those defined in

the specification. The primer sets can be used in antisense therapy and

in gene therapy. The primers are useful for synthesiang polynucleotides,

constant and/or diagnosis of the abnormality of the proteins encoded by

constant without any specialised methods. AAH0316 to AAH13628 and

AAH3633 to AAH13642 represent human cald sequences; and AAH13629 to AAH13632

represent oligonucleotides, all of which are used in the exemplification

of the present invention. of the present invention.

                                                                                                                                                                                                                                                                                                              AAX20500-21243 represent polynucleotide sequences from the genome of Treponema pallidum. The sequences can be used for detection, diagnosis, characterisation, prevention and therapy for T. pallidum infections, particularly syphilis. They can also be used for detecting diseases related to Borrella infections in animals, and for the production of biosynthetic products such as enzymes.

AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I)

amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic

cc activity, and can be used in gene therapy and vaccine production. (I)

proteins and polynucleotides may be used in the prevention, diagnosis and

treatment of diseases associated with inappropriate (I) expression. For

example, they may be used to treat disorders associated with decreased

cxpression by rectifying mutations or deletions in a patient's genome

that affect the activity of (I) by expressing inactive proteins or to

supplement the patients own production of (I). Additionally, (I)

cc supplement the patients own production of (I). Additionally, (I)

cc plynuclectides may be used to produce the secreted (I), by inserting

ct he nucleic acids into a host cell and culturing the cell to express the

cc protein. (I) proteins and polynucleotides may be used to prevent,

cc diagnose and treat immune/haematopoietic-derived cells. AAK64703

cc cancers and cancer metastases of haematopoietic antigen genomic

cd AAK87694 represent human immune/haematopoietic antigen genomic

sequences from the present invention. AAK54942 to AAK54950 and AAM82169

cc represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         7051 AAATTICAAAATTCAAAAGAAAGACTCTAGGCAATGAGAAAAGAATCCCATTTTAAATA 6992

The present invention describes isolated anthranilate synthase alphasbubnit (ASAS), and thranilate synthase beta-subunit (ASAS), and thranilate synthase beta-subunit (ASAS), and thranilate synthase beta-subunit (ASAS), and thranilate synthase alpha-subunit (TSAS) mucleic acids, and protein encoded by them, obtained from corn, rice, soybean and wheat cDNA in the nucleic acid fragments may be used to create transgenic companies. The nucleic acid fragments may be used to create transgenic libraries. The nucleic acid fragments may be used to create transgenic companies in which they are not normally found. This would have the effect of altering which they are not normally found. This would have the effect of altering to the level of tryptophan in those cells. Manipulation of the levels of some of the ASASs will also results in changes in the response to pathogen attack. Because this pathway is not followed for the production of pathogen attack. Because this pathway is not followed for the production of the discovery of herbicides and fungicides. The ASAS, ASBS or TSAS can be used as targets to facilitate, design and/or identification of inhibitors of those enzymes that may be useful as herbicides. Nucleic acid fragments can also be used as probes for genetically and physically mapping the genes that they are a part of, and as markers for traits in order to develop lines with desired phenotypes. AAZ25109 to AAZ2127 represent specifically claimed nucleic acids from the present invention cand AAV42112 to AAV42110 represent the proteins encoded by them.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

nucleic acid probes for measuring gene expression in a sample derived from human breast and BT 474 cells. The method involves contacting the probes with a collection of detectably labelled nucleic acids derived from mRNA of human breast, and then measuring the label collection of human breast, and then measuring the label count to each probe of the microarray. The probes are useful for cenced proteins. They are useful for genomic DNA predicted to encode proteins. They are useful for special preast disease. Gene expression analysis is useful for assessing the toxicity of chemical expression analysis is useful for assessing the toxicity of chemical expression analysis is useful for assessing the toxicity of chemical expression analysis is useful for assessing the toxicity of chemical expression analysis is useful for assessing the toxicity of chemical diversity of probes for measuring gene expression, with far less bias than expressed sequence tag microarrays. The method is suitable for rapid production of functional information from genomic sequence. The present sequence data for this patent did not form part of the nvention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly continued by the production of the present sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; foetal liver; gene expression; single exon nucleic acid probe; ss.

The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a single exon nucleic acid probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SOURCE INFORMATION:
This clone is from a chromosome X-specific cosmid library LLOXNCCO1
'U'. The source of the chromosomes was a human/hamster hybrid,
GM0729-F, from Robert Nussbaum at the University of Pennsylvania
School of Medicine. Please contact the Lawrence Livermore National
Laboratory at http://www-bio.llnl.gov/genome to obtain the clone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by sequence from more than one subclone; and the assembly was confirmed by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 NOTICE: This sequence may not represent the entire insert of this clone. It may be shorter because we only sequence overlapping clone sections once, or longer because we provide a small overlap between neighboring data submissions.
                                                                                                                                                                                                                                                                             Bukaryota, Metazoa, Chordata, Craniata, Vertebrata, Buteleostomi, Mammalia, Butheria, Primates, Catarrhini, Hominidae, Homo.

Identification, mapping, and genomic structure of a novel
X-chromosamin human gene (SMPX) encoding a small muscular protein
Hum. Genet. 105 (5), 506-512 (1999)
The small muscle-specific protein Cal modifies cell shape and promotes myocyte fusion in an insulin-like growth factor 1-dependent manner
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          245 GCGAATATCAATGGGAGCCTTTCGGGGAGCTGGGCAGCCTCCCAGAAGG 304

NOTE: This is a 'working draft' sequence. It currently consists of 46 contigs. The true order of the places is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                2 (bases 1 to 82586)

```

CLONE LENGTH: This sequence does not necessarily represent the entire insert of this clone. Overlapping regions of clones are only sequenced and submitted once, so the sequence for the remainder of the insert may be found in the record for the adjacent clones. Overlapping clones are noted at the beginning and end of the Features listing.

QUALITY OF INDIVIDUAL BASES: This sequence meets stringent quality standards - estimated error rate less than 1 per 10,000 bases. Reports of lowest quality individual bases and measures of base quality are listed below. Description of the metrics can be found at URL: http://www.hgsc.bcm.tmc.edu:8088/quality.info/genbank.annot ation.html.

ANNOTATION OF FEATURES:

STSs are identified using ePCR (Genome Res. 7:541-550) searches of a local database that includes entries from dbSTS, GDB, and

Repeats are identified using RepeatMasker (A. Smit and P. Green, Repeats are identified using RepeatMasker (A. Smit and P. Green, unpublished.) for Human and Mouse sequences.

(Not. Acids Res. 25:3389-3402) similarity are identified by BLAST EST and cDNA sequences. Genes demonstrate at least two exons flanked by consensus splice sites that maintained sequence continuity across the splice junctions. Sequences that are not identical matches are annotated as similar.

SEQUENCING READ COVERAGE:Sequencing is completed to a minimum standard of double strand coverage with a minimum of 2 clones and 2 reads with no embiguities or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities. If the sequence quality for a region does not meet this standard, it will be indicated in the annotation as Low Coverage.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            libraries were mixed, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from pools of 5,000 clones made from the same 5 libraries. The pools consisted of the following libraries and cloneIDs: Soares NDHSP pool 1: 309304-310919, 323208-325895 Soares NDHSP pool 1: 145032-147335, 147720-148103, 148872-149255, 15002 -150407, 151176-152327 Soares NDHF8-9W pool 1: 758280-760583, 772104-774407 Soares NBHPA pool 1: 758280-760583, 772104-774407 Soares NBHPA pool 1: 304776-306311, 320136-322803, 326280-32663 Soares NBHOT pool 1: 723720-726407, 739080-74099 Subtraction by Bento Soares and M. Fatima Bonaldo."

/note="Organ: eye; Vector: pT773-Pac (Pharmacia) with a
modified polylinker; Site 1: EcoR I; Site 2: Not I;
UI-E-DXO is a cDNA library containing the following
tissue(s): fetal eyes. The library was constructed
according to Bonaldo, Lennon and Soares, Genome Research,
ith an oligo-dT primer containing a Not I site. Double
with an oligo-dT primer containing a Not I site. Double
with Not I, and cloned directionally into pT773-Pac
vector. The oligonucloctide used to prime the synthesis of
first-strand cDNA contains a library tag sequence that is
sequence tag for this library is AGAATCAAGA. This library
was created for the program, Gene Discovery in the Visual
System, supported by National Eye Institute (NEI)." 0; Gaps 0

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /lab_host="DH10B (Life Technologies) (T1 phage resistant) "
/note="Organ: eye; Vector: pT7T3-Pac (Pharmacia) with a
modified polylinker; Site_1: EcoR I; Site_2: Not I;
UI-E-DX0 is a cDNA library containing the following
tissue(s): fetal eyes. The library was constructed
according to Bonaldo, Lennon and Soares, Genome Research,
6:791-806, 1996. First strand cDNA synthesis was primed
with an oligo-dT primer containing a Not I site. Double
stranded cDNA was ligated to an EcoR I adaptor, digested
with Not I, and cloned directionally inco pT7T3-Pac
vector. The oligonucleotide used to prime the synthesis of
first-strand cDNA contains a library tag sequence that is
located between the Not I site and the (dT)18 tail. The
sequence tag for this library is AGAATCAAGA. This library
was created for the program, Gene Discovery in the Visual
System, supported by National Eye Institute (NEI)."
